

May UPDATE

Hi ,

Product development at Customaite doesn't slow down and this month is no exception. May brings **three updates** to the platform: one new feature and two improvements that make it easier to handle the declarations that don't fit the standard mould.

Here's what's new:

1. Goods Classification Assistant: now with Norwegian HS Codes

The **Goods Classification Assistant** now supports **Norwegian HS Codes**. With this update, Norwegian codes are fully integrated into Customaite's workflow. That means no more switching between systems: you can look up, complete, and validate Norwegian classifications directly in the goods table, just like you would for any other country.

2. Header fields at item-level

In most declarations, certain data is defined once at header level and applies to the entire shipment. But in **specific shipments**, those same fields need to be set individually at the item level and that's where things used to get complicated. Customaite now correctly recognises and processes **header fields defined at item-level**. No more workarounds needed.

3. Multiple Previous Document References

A single tariffline can now reference **multiple previous documents**, a requirement that's particularly common in **Supplementary Declarations**, but that can also arise in standard declarations.

Previously, the model handled one Previous Document reference per tariffline. Customaite now correctly links and processes all referenced documents, so you no longer need to work around this limitation manually.

If you'd like to learn more about any of the above, or see how Customaite could support your customs processes, **feel free to get in touch**.

Best regards,
The Customaite Team
